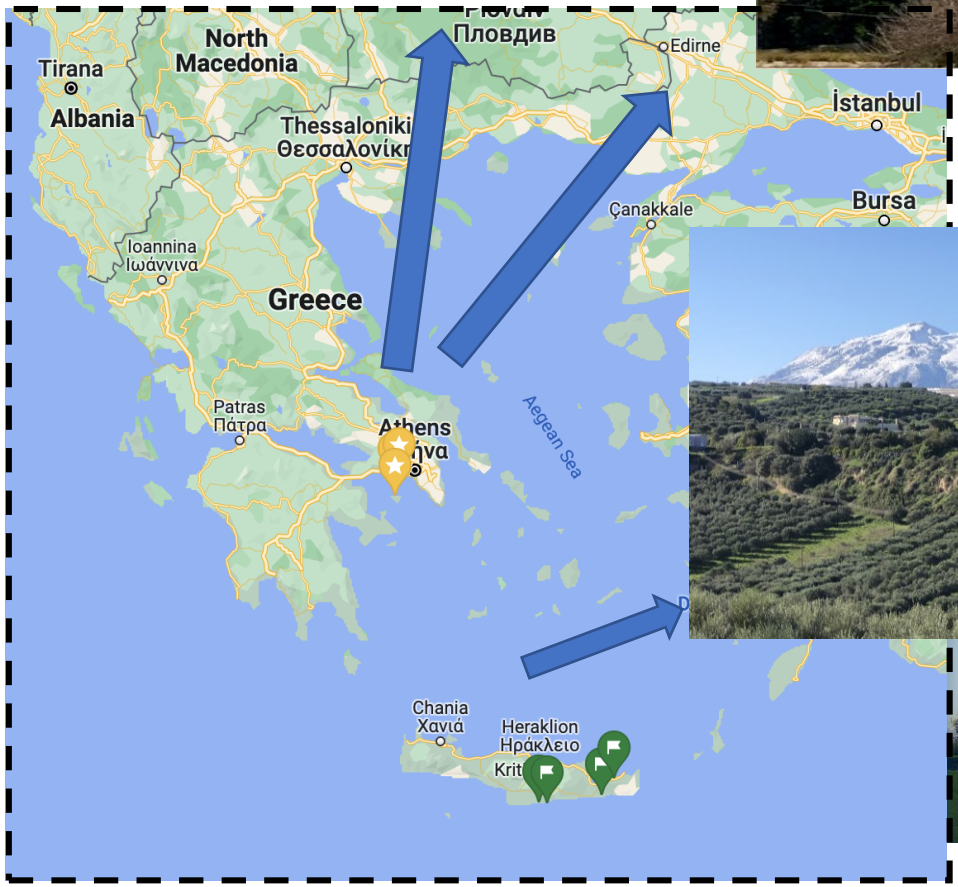
Studying the impact of nascent RNA synthesis on gene regulation

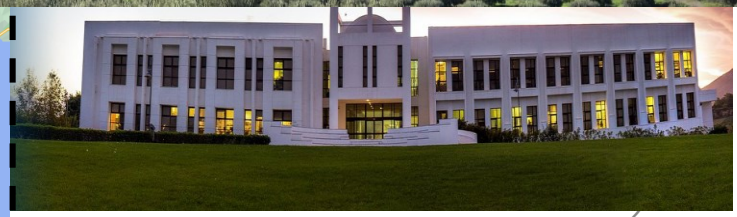
Matthieu D. Lavigne, PhD
Gene Control Mechanisms Lab,
Head of the IMBB Genomics facility,
IMBB-FORTH, Crete, Greece

PhD in Gene medicine, Pr Gorecki lab
University of Portsmouth, UK

MSc Biochemistry
UPMC, Paris, FR

POST-DOCS in IIBEAA (Thanos Lab) and Al. Fleming (Fousteri Lab)





Genomics Facility

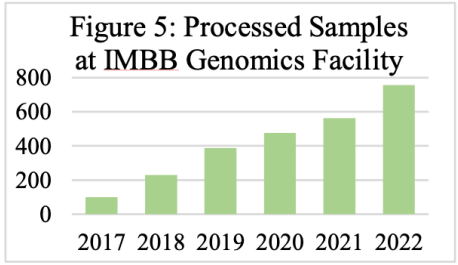
HEAD OF FACILITY

Matthieu Lavigne

FACILITY MEMBERS

Research assistants:
Eirini Stratidaki
Niki Gounalaki

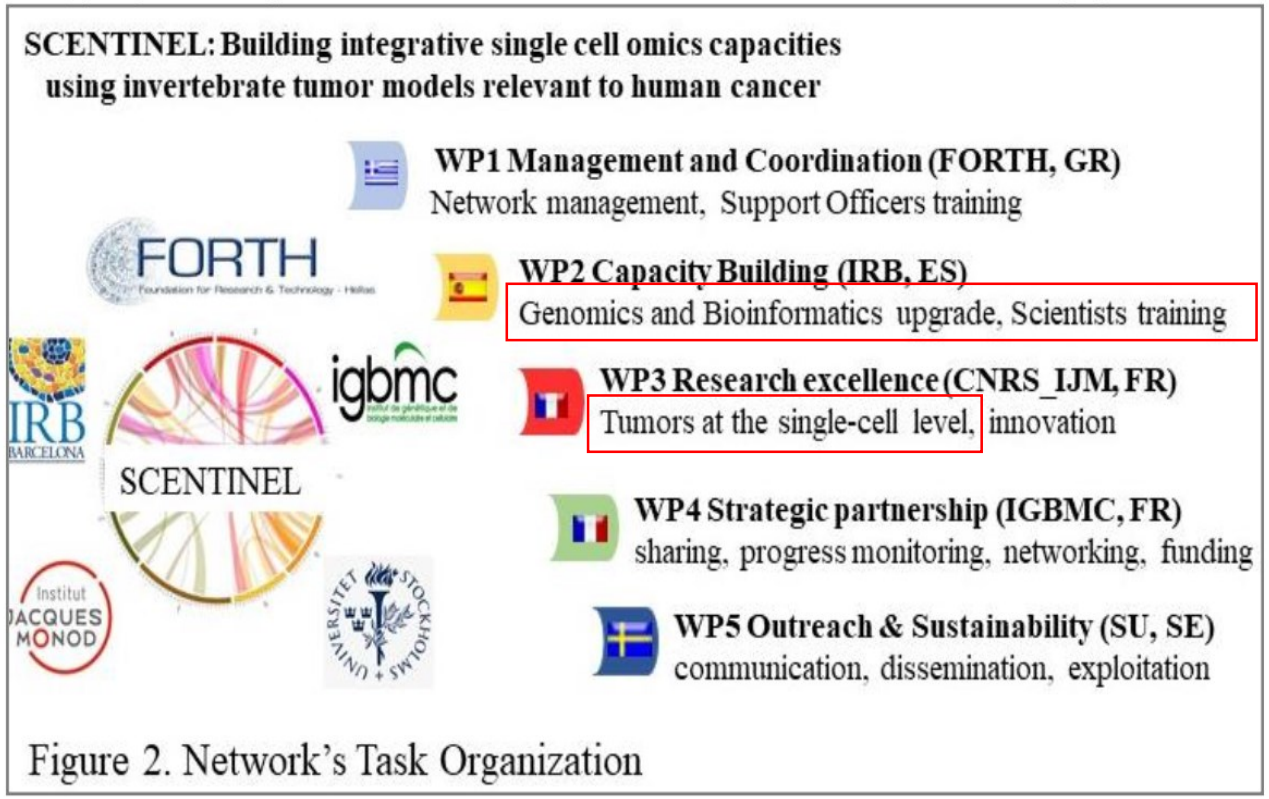
Data management and analysis:
Emmanouil Dialinas



Illumina NextSeq 500 + 2000 (UoC)
Nanopore (ADNA)

-Answers to users needs to look at precious and difficult samples (extremely low input RNA-seq)
-Development of custom workflows (MSAP-seq, SLAM-seq…)
WITH NO CHARGE of technician cost or overheads

TWINNING



Current HIBU (since 2021)
(Horizontal BioInformatics Unit)

Installation and plan for development of High Performance Cluster (HPC)

Elevate IMBB science and innovation capacities and Genomics Facility technological capacity by

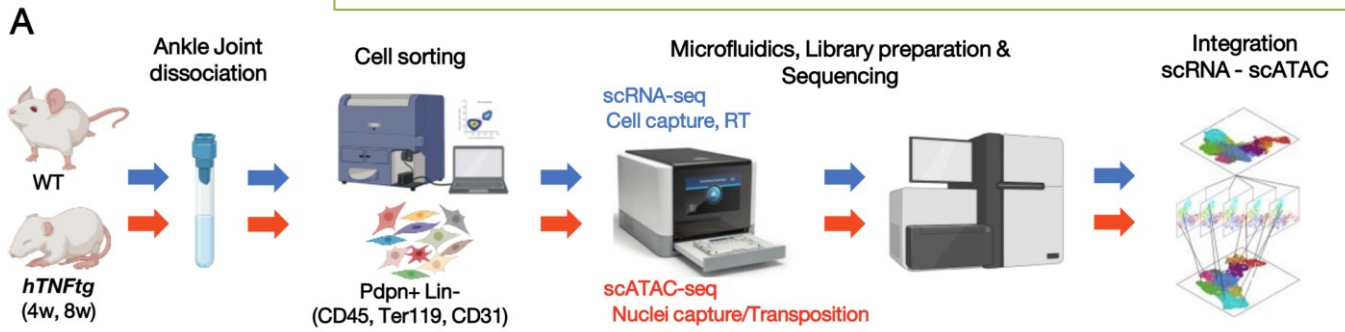
i) bringing expertise to facility's personnel to use new 10 X Genomics platform (purchased by Chamilos/Talianidis)

ii) bring the PIP-seq technology (with A. Pavlopoulos and Enzyquest)

→ **offer single-cell sequencing services to other users** towards the midway of this **twinning** project (2025)

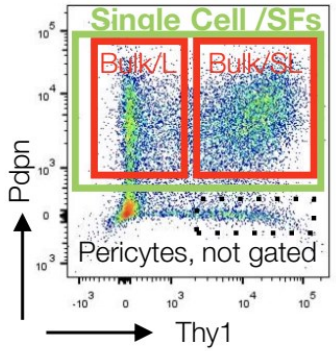
→ Leverage for recruiting one newly trained scientist

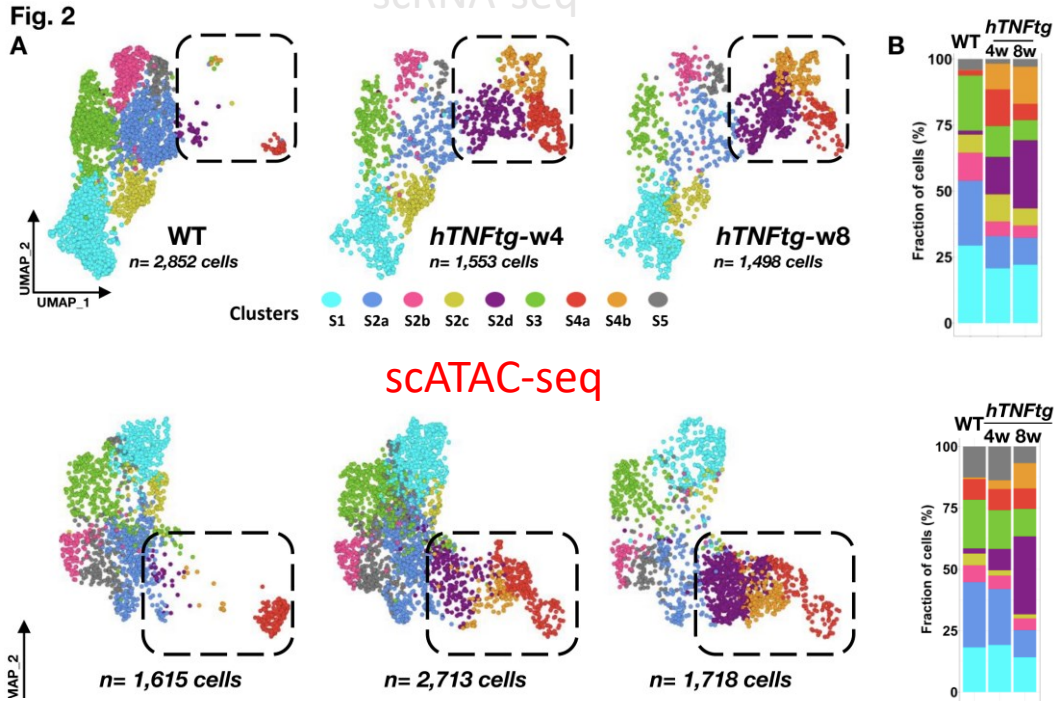
sc multi-omic profiling of Synovial Fibloblasts (SFs)

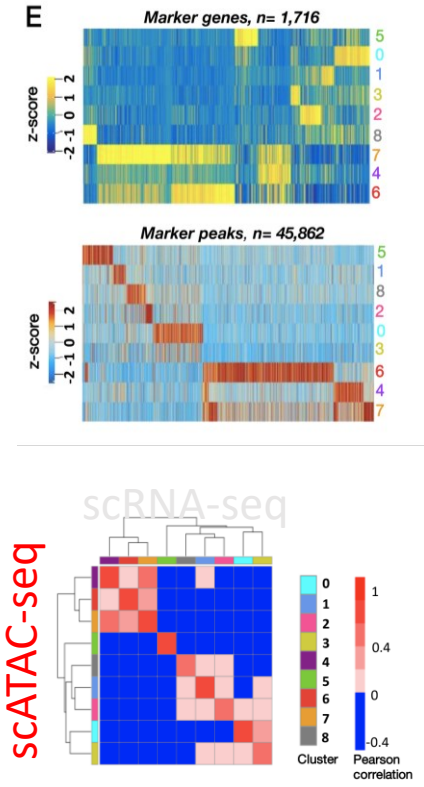


Shared patterns at transcriptional and chromatin levels

Expansion of SFs subtypes in Tg



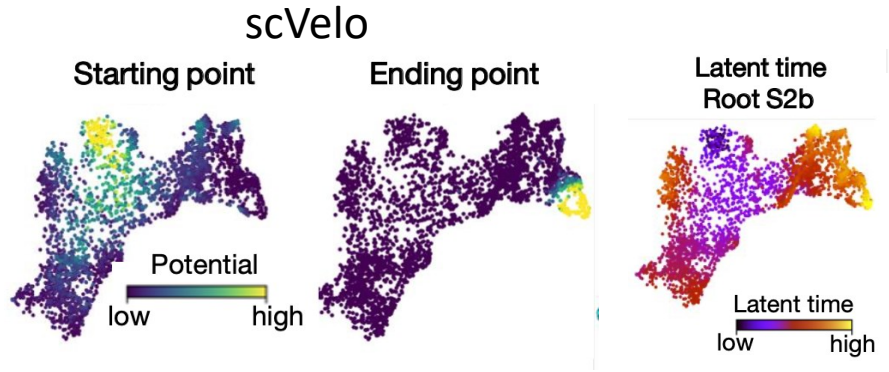




canonical correlation analysis (CCA) enabled the matching of scRNA-seq and scATAC-seq cluster identities

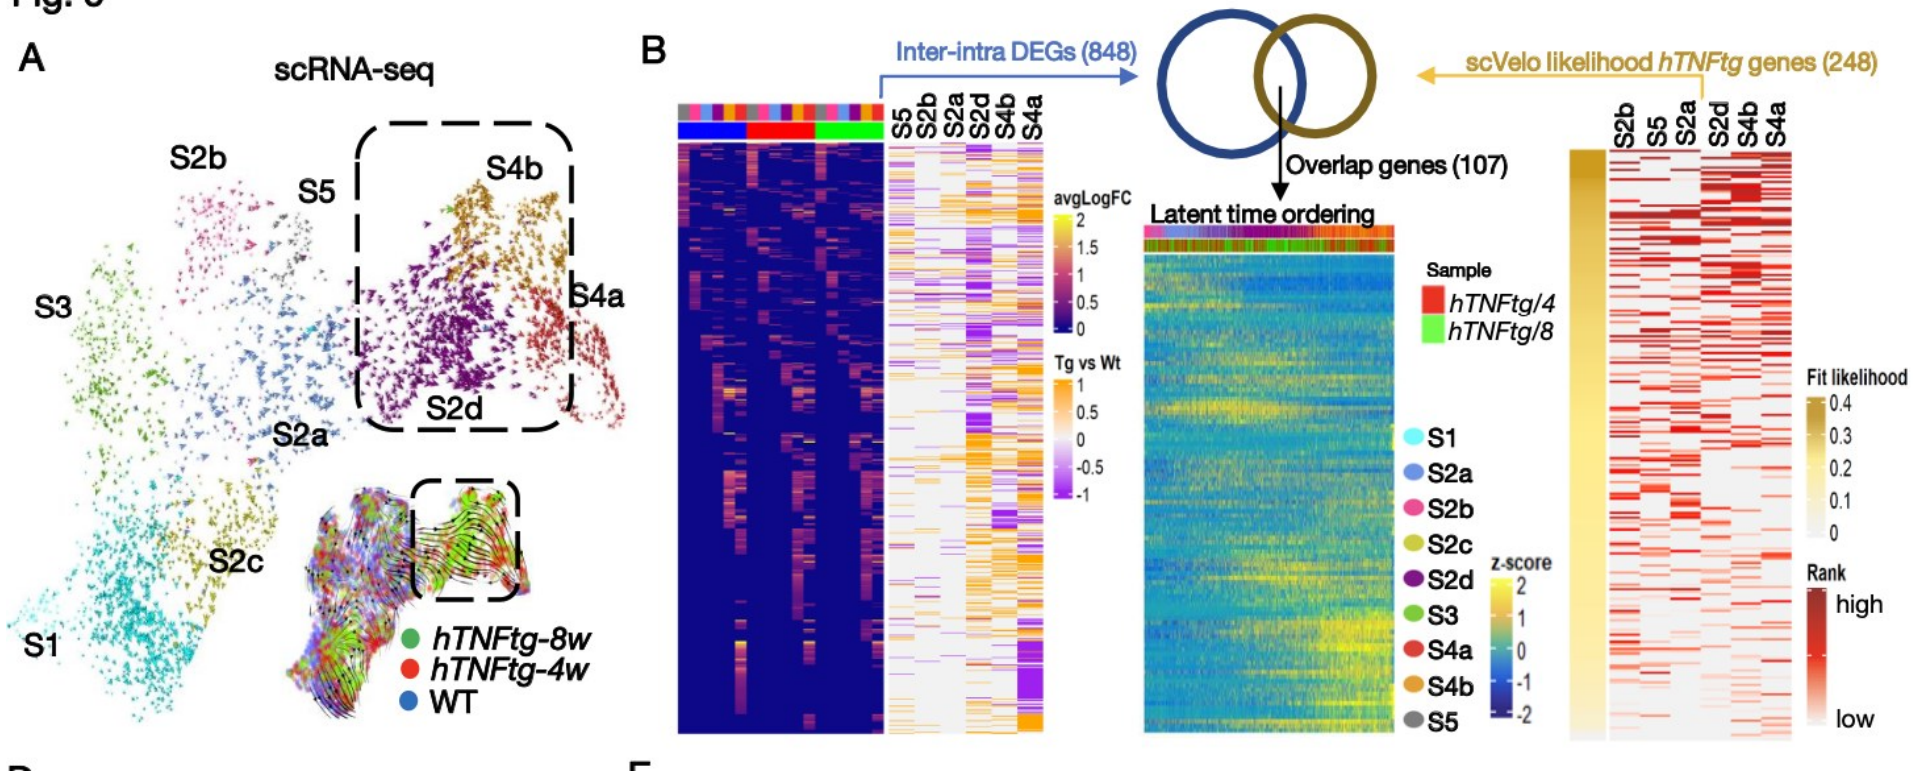
Armaka et al, 2022

A defined trajectory yields pathogenic SFs in diseased joints



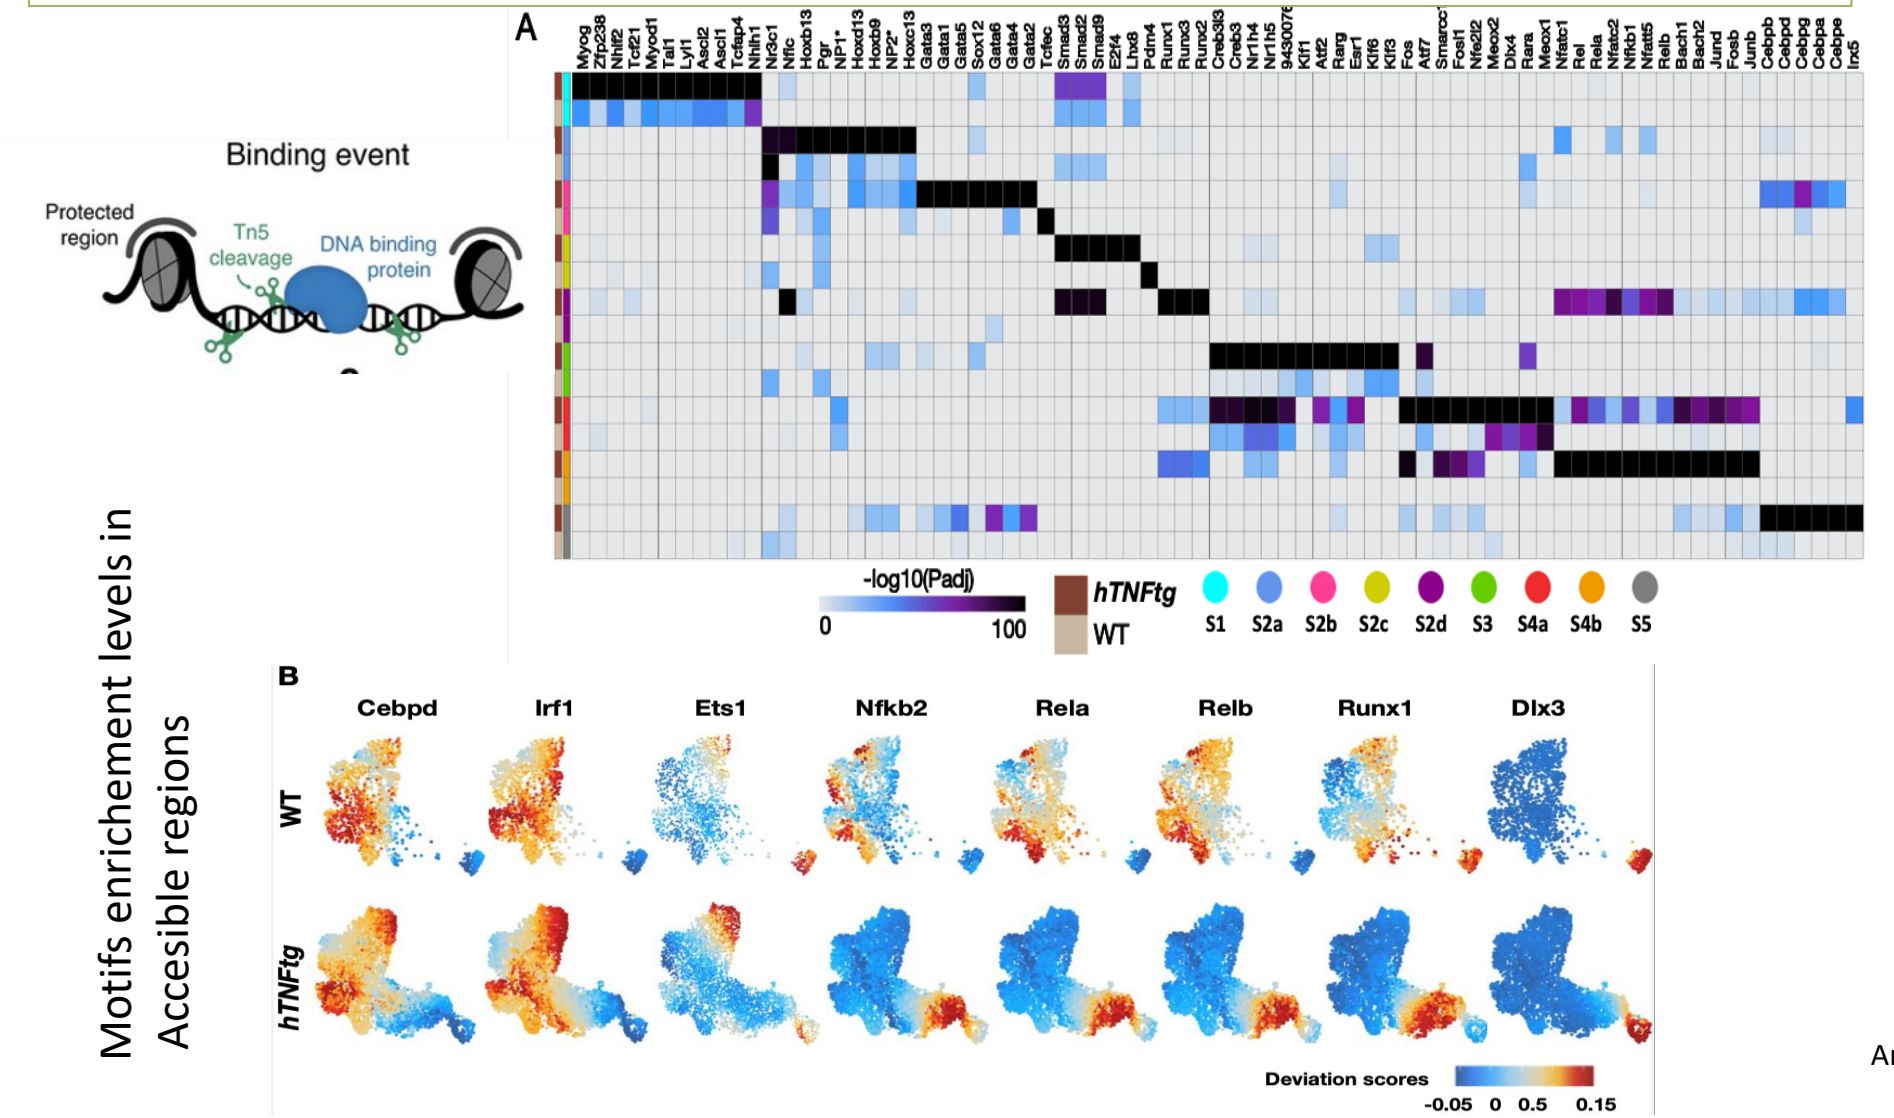
- S2b give rise to the emerging S2d, S4b and S4a SF states in disease
- 107 core genes control the transition to pathological states

Fig. 6



Armaka et al, 2022

DNA motif analyses to determine which TF might control the cell-type or disease-specific regulatory regions and associated genes



Armaka et al, 2022

intermediate and disease lining states are controlled by master regulators including **Runx1**, and Junb/d, **Rel and Nfkb the later** known pro-inflammatory effectors

GENE CONTOL MECHANISM LAB AT IMBB

Established 2021

Hypothesis-driven basic research to find out novel **molecular mechanisms essential for healthy gene expression**

WHY is it IMPORTANT: The **idea to alter activity of chromatin (e.g histone deacetylase (HDAC) inhibitors) to control cancers in the clinic (eg, vorinostat)** has resulted from **prior clear understanding of their mode of action** in transcriptional regulation

Directions of research

How nRNA interactions interactions occur and **what link it to human diseases** such as cancer or neurodegenration

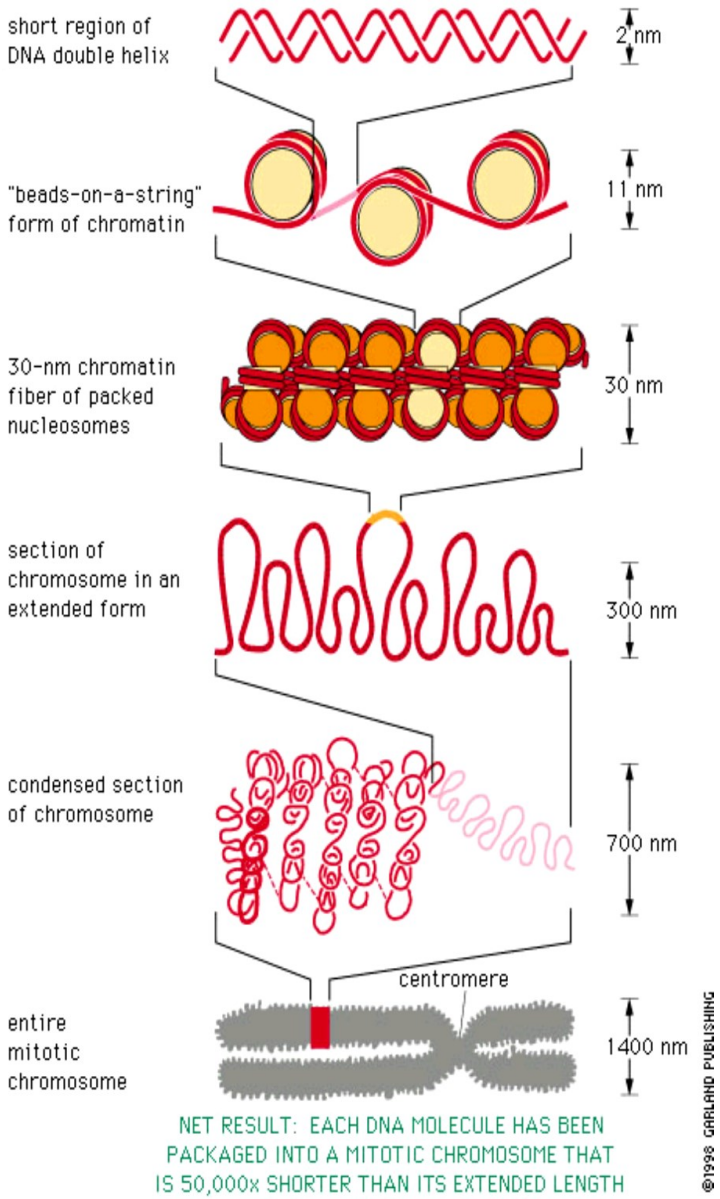
i) Describe **how nascent RNA influence** gene **transcription regulation** and genomic **DNA sequences integrity**

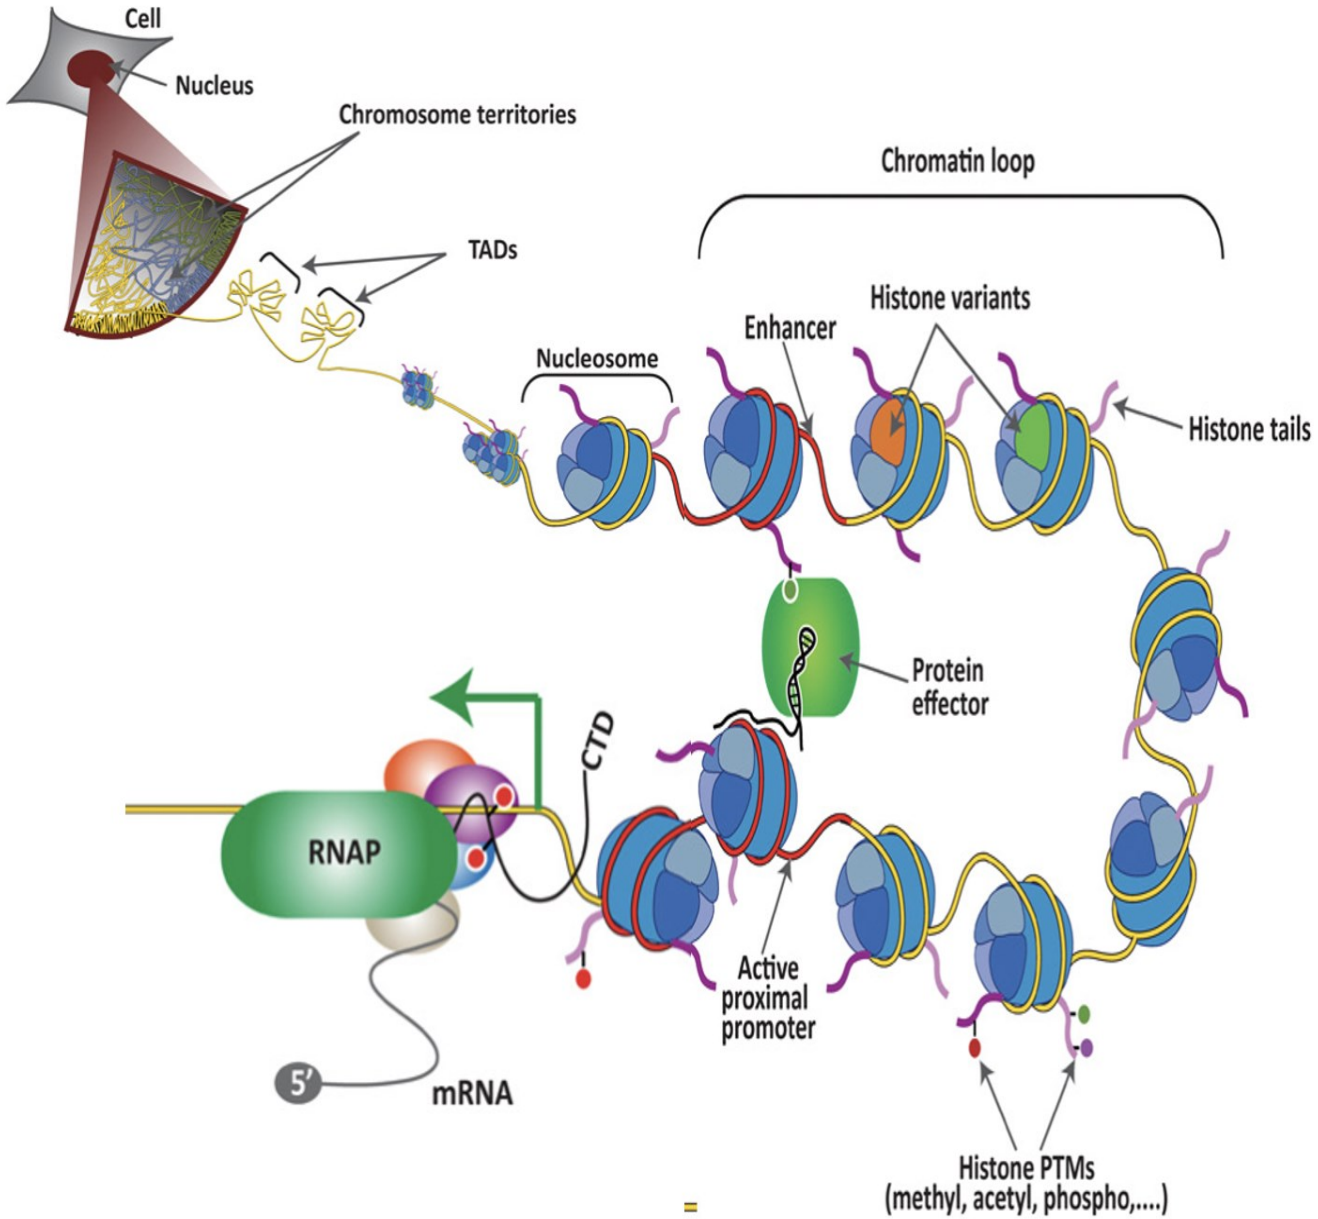
ii) Characterise role of nascent RNA in histone H2B ubiquitination (**H2Bub**) / turn-over rates during transcription

*We **apply both molecular and computational/mathematical biology methods** to integrate data from multi-omics approaches to interrogate protein-DNA-RNA interactions and **learn from data (ML) to model/predict molecular mechanisms** (e.g. ChIP-seq, RIP-seq, HiChIP), RNA expression levels and patterns (mature/nascent RNA-seq, FISH), or chromatin accessibility (ATAC-seq) and modification/conformation status (ChIP-seq, HiC, GRID-seq, Machine learning, Simulation)*

CURRENT/PREVIOUS LAB MEMBERS: Vaios Theodosiou (PhD student), Marianna Stagaki (MSc Bioinformatics, Thesis), Electra Tsaglioti (RA Bioinformatics), Chris Botos (BSc Students), Angeliki Loukopoulou (Msc rotator), Kostis Kydonakis and Myrto Mittleton (MSc MBB, Thesis), Nikos Vouzounerakis, Stergios Manakas, Johnny Petrossian, Electra Kontonikou,

Multi-level 4D genome organisation controls gene expression





TIMELY REGULATED

Pipeline to find enhancer-gene links

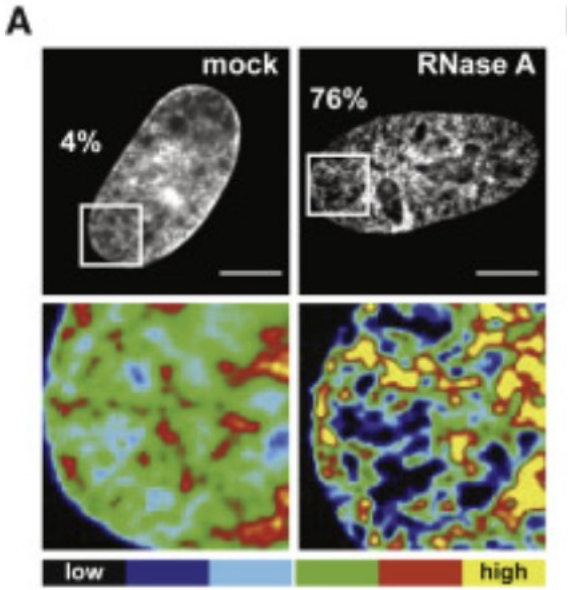
CellPress

Volume 81, Issue 17, 2 September 2021, Pages 3509-3525.e5

Article

Nascent RNA scaffolds contribute to chromosome territory architecture and counter chromatin compaction

Kevin Michael Creamer [1], Heather Jill Kolpa [1], Jeanne Bentley Lawrence [1 2]



nuclear RNA depletion using RNase A disrupts nuclear morphology and causes rapid “collapse” of chromatin into compact regions

PERSPECTIVES

OPINION

Regulatory feedback from nascent RNA to chromatin and transcription

Lenka Skalska, Manuel Beltran-Nebot, Jernej Ule and Richard G. Jenner

modification. Transcription elongation factors bind to sequences at the 5′ end of cellular pre-mRNAs (FIG. 1a), and splice sites influence the Pol II elongation rate and chromatin modification across the gene body (FIG. 1b). At the 3′ end of genes, Pol II pausing occurs after recognition of the polyadenylation site (PAS) by cleavage and polyadenylation factors[12] and owing to

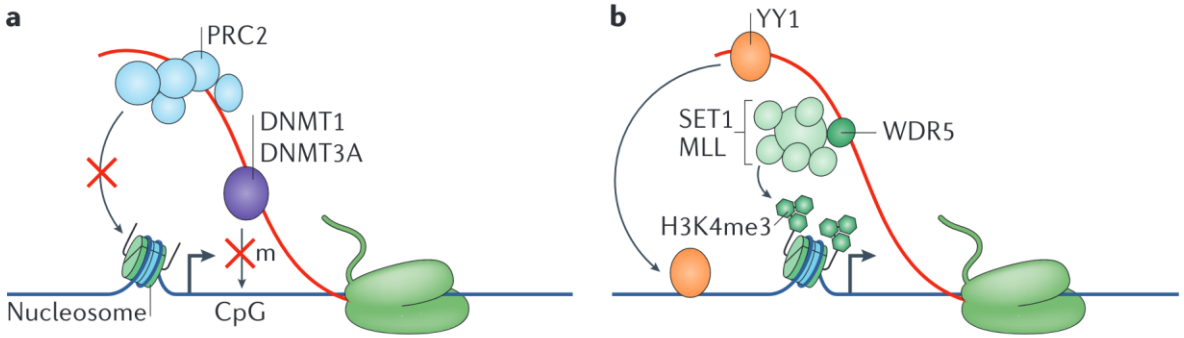


Figure 2 | **Nascent RNA modulates the association of regulatory factors with chromatin to maintain gene activity. a** | Nascent RNA can compete with chromatin for binding of repressive chromatin modifiers, such as Polycomb repressive complex 2 (PRC2), which methylates histone H3 at Lys27, and DNA (cytosine-5)-methyltransferase 1 (DNMT1) and DNMT3A, which primarily methylate the DNA at CpG dinucleotides. **b** | Interaction of the transcription factor yin and yang 1 (YY1) with nascent RNA facilitates its transfer to chromatin. Similarly, the interaction of WD repeat-containing 5 (WDR5), which is a component of the histone Lys methyltransferase complexes SET1 and myeloid/lymphoid or mixed-lineage leukaemia (MLL), with nascent RNA facilitates their transfer to chromatin and trimethylation of histone H3 at Lys4 (H3K4me3), thereby forming a positive-feedback loop that promotes gene expression.

Skalska, NRMCB, 2017

Nascent RNA is modified co-transcriptionaly

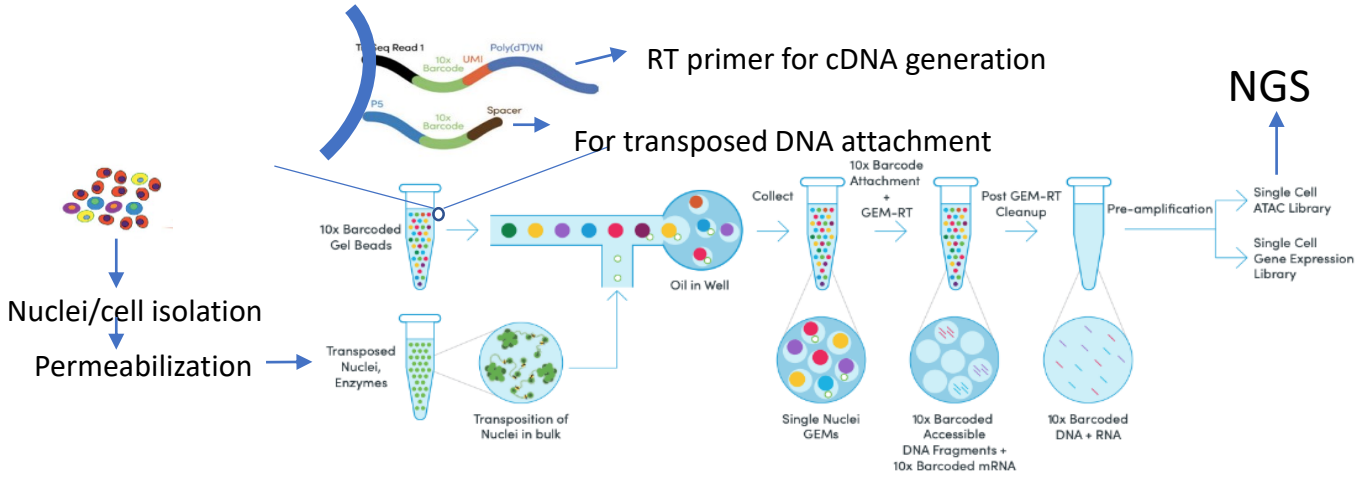
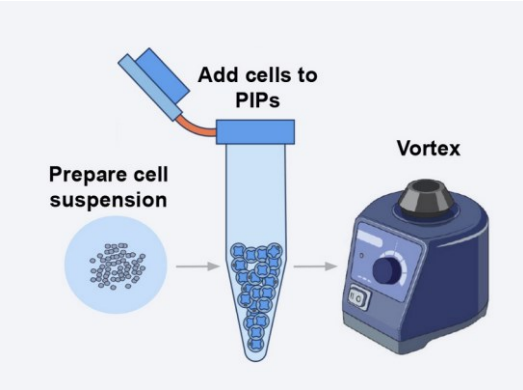
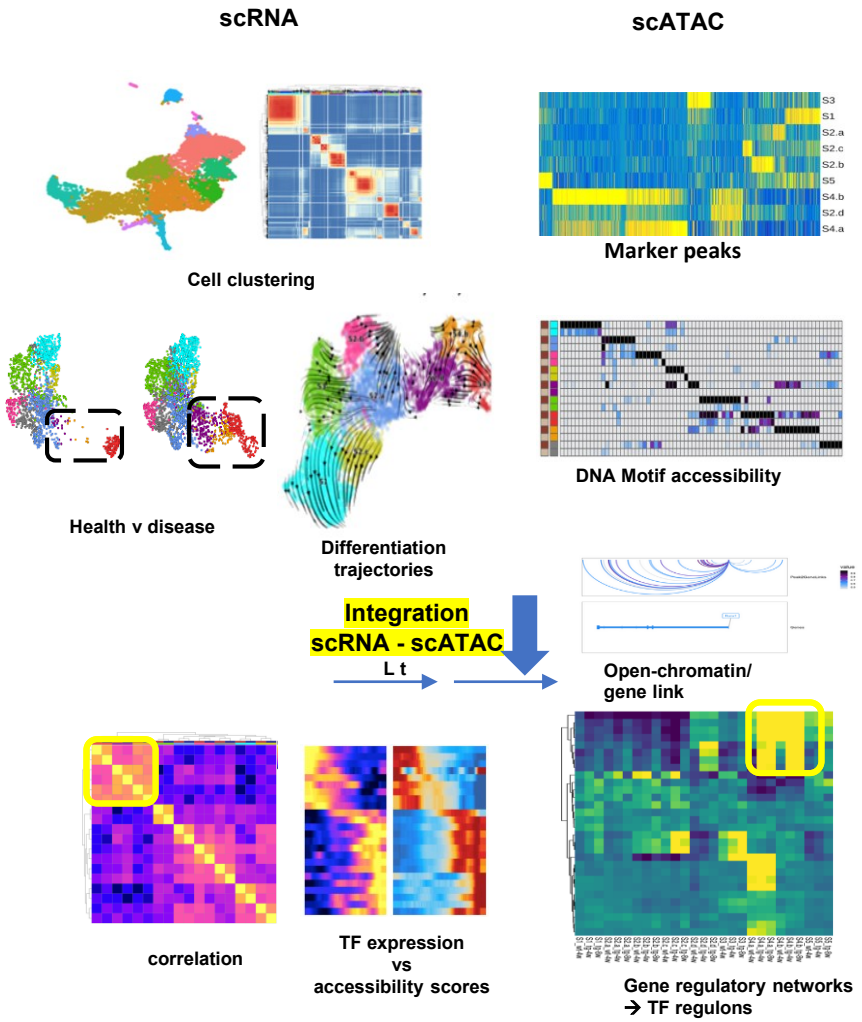
Integrative single-cell (sc) analysis of chromatin and transcriptome dynamics to investigate gene regulatory bases of Disease



10x sc multiome ATAC+ GEX workflow



PIP-seq (Fluent Biosciences with ENZYQUEST)



Methodolgy applied in i) Armaka et al, 2022, ii) Peraki and Botskaris, ms in preparation (in collaboration with Talianidis lab)

Objective 3: Investigating the MOLecular SPEcificity of chromatin CONDensates
MOLSPECOND (FORTH Synergy grant)

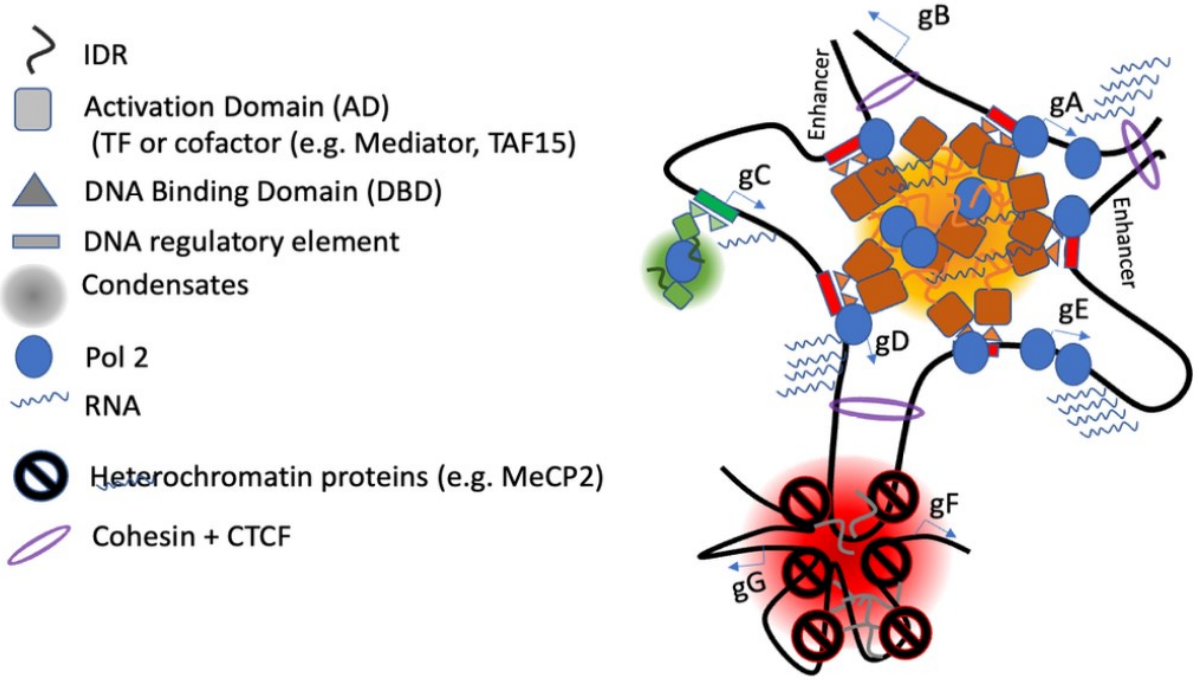


Figure 1: Multivalent interactions lead to the formation of condensates localized to specific genomic regions. A condensate of two enhancers (eRNA is a scaffold to phase separation) and associated promoter concentrate pol 2 (blue) and coactivators (squares) via the interaction of their IDRs and DBDs to increase transcription. Cohesin extrudes DNA into loops until it encounters occupied CTCF DNA-binding sites and participate to the topology of chromatin condensates. Heterochromatin condensates prevent transcriptional activity and segregate inactive regions of the genome out of active sites.

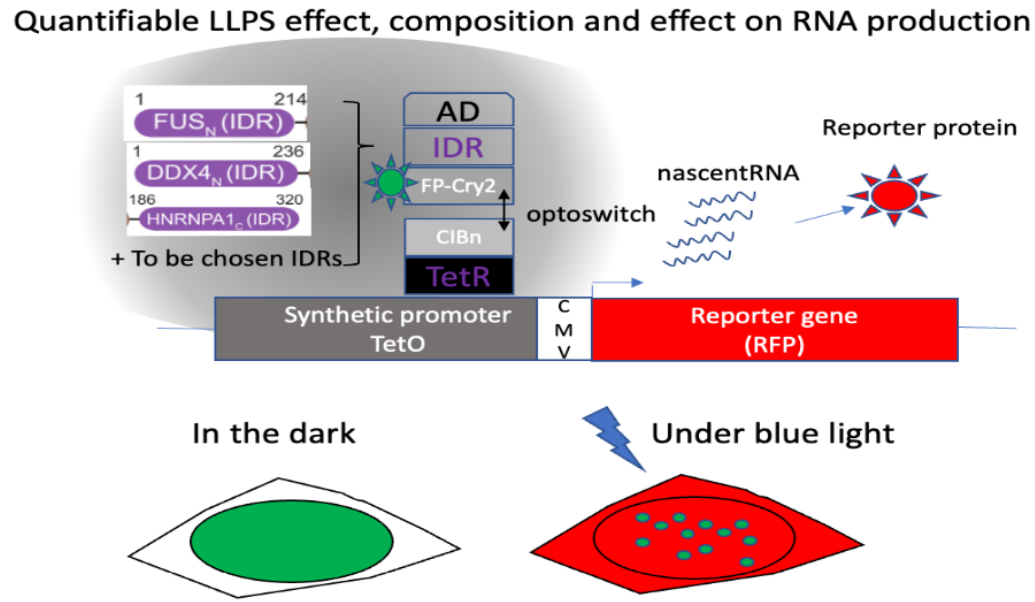

Figure 3: Workflow of in vivo reporter assay to measure the impact of IDR sequence variability on condensate composition upon blue light (Cry2-CIBn) optogenetic switch. Plasmids obtained from Schneider et al, 2021 necessary for expression of all components will be modified to suit our goal to test colocalization and effects on transcription output.

Could Pol II and **active transcriptional processes** be key drivers mediating finescale functional chromatin structures?

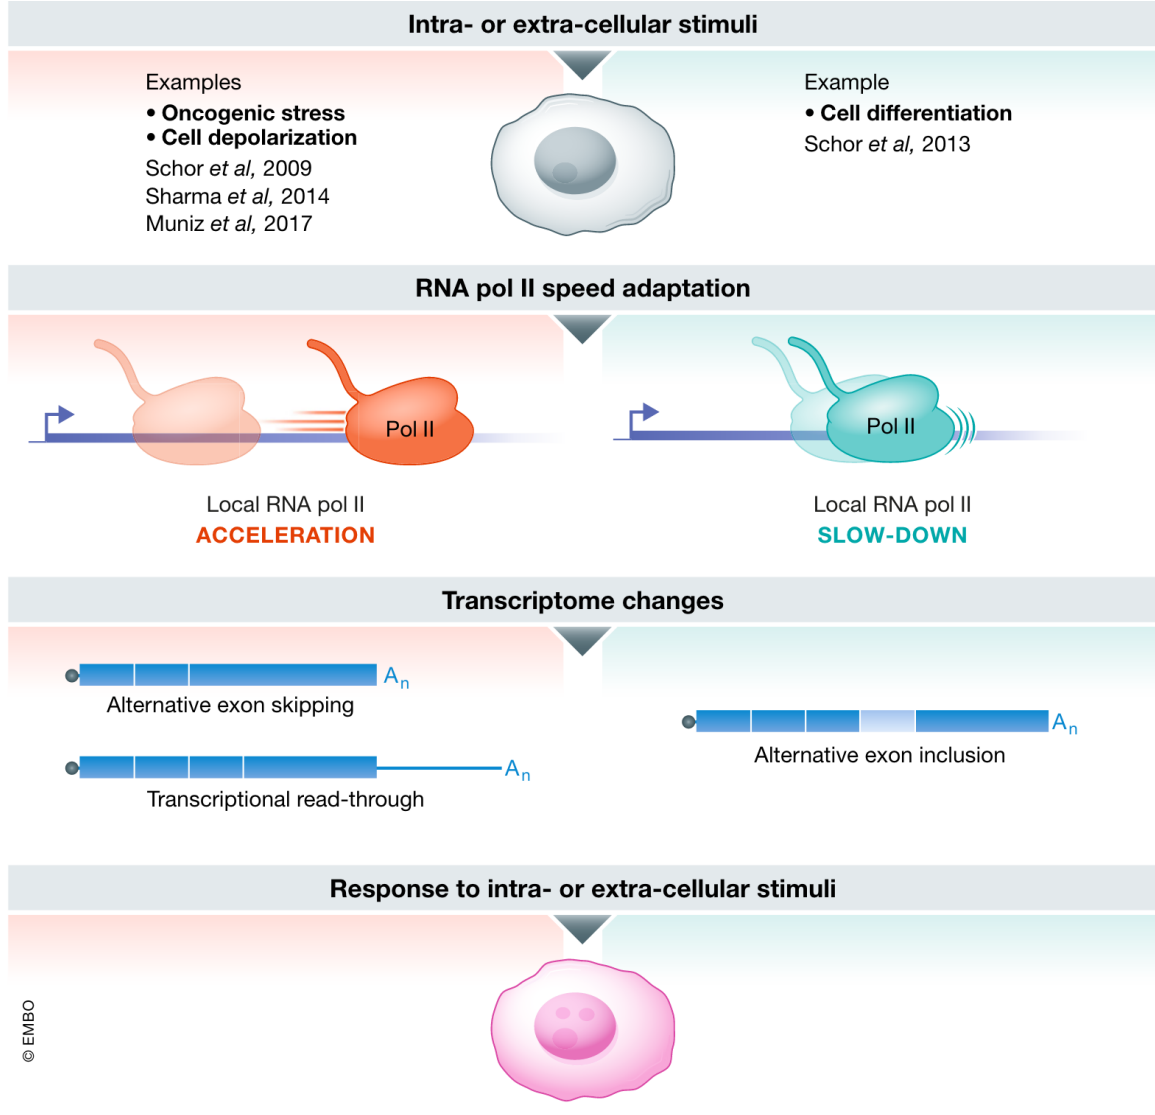

Figure 3. RNA Pol II speed is regulated in order to adapt the transcriptome composition in response to intra- or extra-cellular stimuli.

In response to intra- or extra-cellular stimuli such as oncogenic stress, cell depolarization, or cell differentiation, RNA Pol II can either accelerate or slow down locally, inducing a change in alternative splicing or the extent of read-through which could play a role in the response to stimuli.
